Globant

Globant Piscine

Project 2

Summary: TripRecommendator

Version: 1

Contents

Chapter I

A word about this Project

The goal is to develop a frontend application where users can input their desired trip location in free-text form. Using AI tools and APIs, the app will identify potential travel destinations and display them on a custom map. The design will prioritize a mobile-first approach, ensuring the app is accessible and user-friendly across all devices.

Chapter II

Introduction

What this Project will show you:

- How to create a frontend application with a mobile-first design.

- Handling free-text input from users and processing it using AI tools and APIs.

- Integrating AI-powered tools to interpret user input and suggest relevant travel destinations.

- Displaying locations on a custom interactive map.

- Applying a minimum accessibility standard for improved user interaction.

- Ensuring user experience (UX) remains at the forefront of the application design.

- Exploring advanced features like speech-to-text, image recognition, and drawing areas on a map for enhanced input methods.

Chapter III

General instructions

Unless explicitely specified, the following rules will apply for every project of this Piscine.

- This subject is the one and only trustable source. Don't trust any rumor.

- This subject can be updated up to one hour before the turn-in deadline.

- The assignments in a subject must be done in the given order. Later assignments won't be rated unless all the previous ones are perfectly executed.

- Be careful about the access rights of your files and folders.

- Your assignments WON'T be evaluated by your Piscine peers.

- You <u>must not</u> leave in your turn-in your workspace any file other than the ones explicitly requested By the assignments. If the assignment don't precise them, put only the necessary ones to run your Project.

- Using some API Key or Token? <u>Keep them for you!</u> Do not push them on your repository.

- You have a question? Ask your left neighbor. Otherwise, try your luck with your right neighbor.

- Every technical answer you might need is available in the `man` or on the Internet.

- You must read the examples thoroughly. They can reveal requirements that are not obvious in the assignment's description.

- By Thor, by Odin! Use your brain!!!

Chapter IV

Mandatory part

Globant▶	Exercise 00
TripRecommendator	

Turn-in directory : *ex*00/
Files to turn in : `All needed files to run your Project and nothing else`
Allowed functions : `None`

- Docker is mandatory for this project. You must provide a Dockerfile and a docker-compose.yml file to run your project.

- **Free-Text Input for Trip Location**

  ○ Users will enter their desired travel location or preferences in free-text format.

  ○ The application will process the input using AI tools and APIs to identify relevant travel destinations.

- **AI and API Integration**

  ○ The app will use AI-powered tools to interpret the user's input and suggest potential travel locations.

  ○ These travel destinations will be shown on a custom interactive map.

- **Mobile-First Design**

  ○ The app will be designed with a mobile-first approach, ensuring optimal functionality and usability on smartphones and tablets.

  ○ Responsive design principles will ensure the app adapts well to different screen sizes.

- **Accessibility Focus**

  ○ The app will have a minimum accessibility standard, focusing on ensuring that users with different needs can interact with the app.

- While strict compliance with WCAG standards isn't mandatory, the app should provide a basic level of accessibility.

> You may want to take a look at every technologies referenced in the project description before starting.

Chapter V

Bonus Part

Once mandatory requirements are implemented in the application, you can add any additional features you see fit. Here a quick list of suggestions to give you ideas.

- **<u>Additional Forms of Input</u>**

  - Support for speech-to-text, allowing users to describe their desired travel location verbally.

  - Image recognition functionality, where users can upload or capture images related to their desired travel location for AI interpretation.

  - Ability to draw an area on the map, letting users manually highlight regions of interest for their trip.

- **<u>User Experience Focus</u>**

  - The overall user experience (UX) should be smooth and intuitive, focusing on easy navigation and quick access to the list of travel locations.

  - Providing users with a curated list of destinations based on their input should always be the main priority.

> Those are only examples. The sky's the limit so again, once mandatory functional requirements are met, we are open to any additional functionalities you see fit.

Chapter VI

Submission

- Create a git repo (Github, Gitlab, Bitbucket, etc) and add your project files to it.

- Copy the link to your repository and paste it in the project submission form.

- Project submission form: TYPEFORM

Please note, no modifications made on the repo after the form is sent will be taken into account for the evaluation.

No Peer evaluation for this Piscine, but feel free to share your project with your peers and get feedback.
